The present segmence is that of the mutine anti-idiotype monoclonal that body (Mbb) 1A7 variable 1ght chain, Mb 1A7 variable against the anti-ganglioside 2 (DD2) Mb 1402a, which binds a raised against the pitope of DD2. As the glycosphingolipid GD2 is expressed WP 100 chainsty by human neuroscrodernal tumpours, e.g. malignatum almona, of the lung, Mb 1A7, or its cDNA can be used in a vaccine to treat of the lung, Mb 1A7, or its cDNA can be used in a vaccine to treat risk of recurrence of a clinically detectable tumour, and detect an x4b 1A7 overcomes immune tolerance and induces an immune response against GD2, which comprises anti-GD2 bh (Mmoral response) and GD2-specific cells (cellular response). It can be used to rest of the comprise anti-DA7 LAM1), anti-GD2 bh (Ma), detectable tumour, and detect anti-LA7 or anti-GD2 in a sample or measure the level of cellular anti-1A7 or response in a sample or measure the level of cellular anti-1A7 or response or the comprise of the comprise anti-DA7 (DA1), anti-GD2 bh (Ma). anti-GD2 activity.
The CDNA can be used in expression systems for 1A7 prodm., and in the progm. of probes and primers to respectively sassy for 1A7 CDNA, and amplify desired polynucleotides for use in gene therapy invaried on 25-MAR-2003 to correct PR field.)

The invention provides a method of treating of peoriasis by administering an antigen which has similar immunogenic properties to an antigen expressed on cells of peoriatic tissue so that an immunological response is elicited in the individual. The antigen stimulates the generation of causing the peoriasis are method is used to treat peoriasis, especially experience of the peoriasis. The method is used to treat peoriasis, especially expert plaque type pooriasis or peoriatic actions of people allow the subministry pooriatic expenses allow the individual's com immune system to cat solids. The composition allow the present sequence represents the light can writing the sequence regression of monocoronal antibody law.

Monoclonal antibody 1A7 which elicits an anti-GD2 immunological response, useful for the development of products for the detection treatment of cancers

N-PSDB;

AAZ31365

Claim 1; Fig 1; 74pp; English

The invention provides a monoclonal antihody (MAD) designated 17, which elicits an anti-fo22 (tunor-associated antigen) immunicational response in sequences. The MAD 1A7 has defined light and heavy chain variable regions anti-GD2 immune response. The polypeptides can be used for eliciting an anti-GD2 immune response. The polypeptides can be used for eliciting or purifying anti-GD2 antibody. The products can be used for treating GD2 associated diseases, e.g. melanoma, neuroblastoma, glioma, soft tissue carcinoma, and small cell carcinoma. They can be used for politating the disease or for reducing the risk of recurrence. The present sequence represents the light chain variable a region of MAD 1A7.

mis polyrepride is the variable light chain region of monoclonal anti-diotype antibody 1A7. The polyrepride has three CDBs (complementarity determining regions) and four frame work regions. Men administered to an individual the 1A7 antibody induces an immune response against ganglioside GD2. The heavy chain variable regions of the 1A7 antibody share antibody and 11ght chain variable regions of the 1A7 antibody produce anti-GD2 T cell and antibody responses. The peptides and antibodises may be useful for the modulation of ganglioside GD2, and particularly for the treatment of GD2-associated ummours e.g. melamona, including small cell lung concer).

 The present invention describes the use of a polypopride (1) in the communication of a medicament for stimulating a cytoroxic Total response, where (1) comprises a first portion comprising the part of human Fe that the binds to Chef and a second portion comprising the part of human Fe that the polypoprise in a platient quot as a mamma, preferably human, by the comprise in a platient quot as a mamma, preferably human, by the part of human is polypoprise in a patient quot as a mamma, preferably human, by the part of the patient (1) has cytoriatic activity and can be unsafelying to polypoprise in a patient (1) has cytoriatic activity and can be unsafely in the manifecture of a medicament for extending (1) are certain active that the manifecture of a medicament for preventing addor treating contains a concert, or coall response. The polypoptides and nucleic acide are useful in the coal coal response. The polypoptides and nucleic acide are useful in coal coal coal patient of coal patients and polypoptides and nucleic acide are useful in a coal coal coal patient of the coal patients and patients and patients and patients and patients and patients and patients are useful in a vaccinus for enhancing a protective immune of coal patients and patients are useful and a patient of the coal patients and patients are patients and patients and patients are patients and patients and patients are patients and patients and patients and patients are patients and patients and patients and patients and patients and patients are patients and patients and patients and patients and patients and patients are patients and patient

The invention provides a monoclopal antibody (Mab) designated 1N, which elicits an anti-GD2 (twoer-associated antiden) immunological response in sequences. The Mab 1N7 has defined light and heavy chain variable region sequences. The Mab 1N7 and polypeptides can be used for eliciting an anti-GD2 immune response. The polypeptides can be used for liciting an anti-GD2 immune response. The polypeptides can be used for provider and the season of the se

 The present invention describes a transgenic, non-human animal with its genome altered to committatively express a molecula having a consent region which can bind an IgE receptor on mast cells in the animals, the wolecula having an immunopicabilin structure and being further capable of specifically binding a predetermined antigen. The transgenic animal is useful as a nodel for evaluating the activity and the ability of substances i.e. with antiallargic activity, to affect any allergic reaction caused in the animal by the administration of the antigen to the animal, and applying the substance to be evaluated. The present expanses is the mouse immunopicabilin is (193) 1191 this in, yiven in

Anti-FIX/FIXa antibody 198/AB2 scrv.

Factor IX, FIX, Factor IXa; FIXa; scFy, antibody; procosquiant, Factor VIII codeactor; blood cosquiation disorder; haemophilla h, haemorrhagic diathesis; haemostatic; anidolycle; therapy; mouse.

Chimeric - Mus musculus. Chimeric - Synthetic.

 The invention relates to a novel monoclonal antibody having the identifying characteristics of, or that is a monoclonal antibody 1473. An antibody of the invention has osteopathic, antirhamatic, antiarchiritic, antiarchiritic, antirinflammatory, cytostatic, antirinflammatory, the polymucleotides encoding the antibodies and neuroprotective activity. The polymucleotides encoding the antibodies of the invention may have a use in gene therapy. The antibodies and polypeptides are useful for treating or preventing osteopathic diseases, such as rhemmatocia, archiritis, osteoppools, metastatic, and primary bone

 The invention relates to anti-NANK monoclonal antibodies which has the identifying characteristics of monoclonal antibody AM. The antibody or polypeptide is useful for treating or preventing ose-eopenic diseases (e.g., rhewardoid arthritis, ost-eopenies, metastatic and primary bone cancer, wear debris induced ost-eolygis or ost-eolythitis) or immure diseases (e.g., poprisais, insulin dependent disheres, inflammatory bowel disease or multiple sclerosis). The antibody is also useful for treating and disgnosing conditions mediated by the NANK ligand. The present sequence is mouse entitlody 2A4 heavy Chain variable region.

 New antibodies have been developed which are specific for human parathormone ratated peptides (horper). The antibodies comprise chimeric Land/or H chains, where the C region is of human and L region of mouse, origin. The persent sequence represents a specifically claimed region of an antibody of the invention. Host cells, transformed with vectors containing DNA encoding antibodies of the invention, can be used to produce the antibodies of the invention, containing DNA encoding antibodies and be used to treat produce the antibodies. The antibodies may be used to treat produce the antibodies of the invention, or cancers of hypercalcamen a sepecially that due to a malignancy, e.g. cancers of hypercalcamen as packed by the composition of malignancy is produced. They hadder, womb or prosess or malignancy is produced. They was also be used for treatment of hypophosphaenia such as that due to marked one or treatment of hypophosphaenia such as that due to marked one or treatment of hypophosphaenia such as that due to marked one or treatment of hypophosphaenia such as that due to

 The invention relates to a method of treatment of hypercalcenic orisis.

A composition for the treatment of hypercalcenic crisis contains as
active component a substance which inhibite the binding of parathyroid
hommone related peptide (PTHFP) to its receptor. The inhibitor is used
for the treatment of hypercalcenic orisis, such as that associated with

 Ś
 S
 or The present sequence is that of a single chain PV (scPV) derivative of antiboly 199/AB2, comprising the heavy (PH) and inject (PU) chain variable regions of 199/AB2 joined by an artificial, flexible linker peptide. The scPV was obtained by PCR amplification of cDNAs for 199/AB2 WH and VL regions and cloning in vector pDnP2. 199/AB2 is an transple of PH1. Immanis actors IX FDY)/AB2 is contracted accors IX (FDXA) (PH2) and CONTRACT (FDXA) (PH2) and CONTRACT (FDXA) (PH2) and CONTRACT (FDXA) (PH2) and CONTRACT (PH2) and C

 The present sequence is that of a fusion procein comprising, a Pell Beader; a single chain Py (serv) derivative of antibody 198/81 comprising the heavy (WH) and light (WL) chain variable regions of 198/B1 joined by an artificial flexible linker pedid; a spacer; Becherichia coli alkaline phosphataes; and a C-peminal dr; a spacer; affinity tail. 198/B1 is an example of anti-human Ractor IX (PIX) /Activated Pactor IX (PIX) antibodies of the invention. Anti-FXX/FIXa antibodies and their derivatives, including scrytagenits, have FVIIIa cofactory activity or FIXa activating tragments, have FVIIIa cofactory activity or FIXa activating.
 New factor IX/factor IXa antibodies and their derivatives useful for
increasing amidolytic activity of factor IXa, and for treating blood
coagulation disorders such as haemophilia A and haemorrhagic diathesis

 The invention relates to identifying differences (I) in mammalian species specific surface amino acid residues on an immunojohbili which converts the antigenicity of a first menalish species to a second menalish species. The new method is used for identifying the second menalish species. The new method is used for identifying the second menalish species while and replacing immunojohbilin surface amino acid residues while and to second menalish species. The method simultaneously reduces the immunogenicity acterior species. The method simultaneously reduces the immunogenicity acterior method simultaneously reduces the immunogenicity and second menalish structly preserves identifying the present sequence in the case of the primer used in the construction of the "weneversity laters to be present sequences in the case of a real primer used in the construction of the "weneversity laters have yet all the construction of the "weneversity laters have yet in the construction of the "weneversity laters have yet in the construction of the "weneversity laters have yet in the construction of the "weneversity laters have yet in the construction of the "weneversity laters have yet in the construction of the "weneversity laters have yet in the construction of the "weneversity laters have yet in the construction of the present sequence is a bar of a real property of the present sequence is a bar of the present sequence in the present sequence is a bar of the present sequence in the present sequence is a bar of the present sequence in the present sequence is a bar of the present sequence in the present sequence is a bar of the present sequence in the present sequence in the present sequence is a bar of the present sequence in the present sequence in the present sequence is a present sequence in the present sequence in the present sequence in the present sequence in the present sequence in the present sequence in the present sequence in the present sequence in the present sequence in the present sequence in the present sequence in

 infarction, acute kidney failure, chronic rhemmatism, cardiac short, pancreatitis, adult respiratory distress syndrome and collitis. The antibodies were generated by immunising Balb/C mice with recombinant human type II phospholipase A2. Spleen cells from the nice were obtained were screened for phospholipase A3 inhibitory activity. Active Clones were isolated Finchiding 1285, 1.4 and 10.1. These were subtracted and the antibody isolated from the culture supernatant by precipitation with ammonium sulphate and purification on a column of protein A sephacose CHB. Because the antibody acts on the primate and mouse forms of enzyme as well as human it is particularly sultable for precipitation testing.
 Sequence
 pancreatitis, cerebral infarction, acute kidney failure; colitis, chronic rheumatism; adult respiratory distress syndrome; cardiac shock; treatment; preclinical testing; disease; hybridoma
 Monoclonal antibodies which inhibit type II phospholipase A2 useful in the treatment of myocardial infarction, cerebral

 Comment sequence represents the monoclonal antibody 1.4 light chain cagainst type II phospholipase A2 from the present invention. The carbon describes a novel method for the ameliocation of caldiny discorders (such as acute ranal failure) associated with the administration of cisplatin for the treatment of cancer. The method comprises treatment with a monoclonal antibody which inhibits the activity of type II phospholipase A2 (particularly of type II I companies the antibody activity and containing a part of the apparatus of the antibody agreemers. Preferably the antibody again shibits the activity of type II phospholipase A2, and has the ability to cape and/or mouse type II phospholipase A2, and has the ability to cape and/or mouse type II phospholipase A2, and has the ability to cape and the complete antibody against the activity of the same antibody against the apparatus of the cape used its used close antibody against the activity of the same and the same and the same properties which can be used its used close antibody against the same antibody against the same and therefore a laurence and the same activity of the same and the

 This is the amino acid sequence for the light chain of muMATS.11, a novel antibody which specifically binds to the platelet derived growth beta receptor (FDGF-R beta), but not within the fifth extracellular 3g-like domain, where the antibody inhibits PDGF beta receptor. Be induced proliferation of a cell expressing the PDGF beta receptor. The antibody can be used in a method of inhibiting intumal hyperplasia in the vasculature of a mammal. The antibodies can be used for the treatment of disorders related to PDGF activity such as disorders involving poliferation of smooth muscle cells, and including receptors.
 Antibodies to platelet derived growth factor beta receptor - inhibit
PDGF BB-induced proliferation of cells expressing the receptor, used
particularly for inhibiting intimal hyperplasia

A;Title: SAM1, the structural gene for one
A;Reference number: A92621; MUID:88059059;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          R; WOhldmann, P. submitted to the EMBL Data Library, November 1994 A; Description: The sequence of S. cerevisiae cosmid 9470
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 15
SS1425
SS1425
Methionine adenosyltransferase (BC 2.5.1.6) 1 - yeast (Saccharomyces cerevisiae)
Methionine adenosylmethionine synthetase 1
N;Alternate names: protein 19470.9; protein YLR180w, S-adenosylmethionine synthetase 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          C;Superfamily: methionine adenosyltransferase C;Keywords: S-adenosylmethionine; transferase

OM protein - protein search, using sw model Run on: November 7, 2003, 07:21:18; Search time 1.15354 Seconds (without alignments)
652.278 Million cell updates/sec

Scoring table: Sequence: Perfect score: US-09-661-992B-105 80 BLOSUM62 CXXYGNSPKGFAYXXC 16

127863 seqs, 47026705 residues Gapop 10.0 , Gapext 0.5

Total number of hits satisfying chosen parameters: 127863

Minimum DB seq length: 0
Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database : SwissProt_41:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result heing printed, and is derived by analysis of the total score distribution.

threonine in a two-esp reaction. The first step is a debydration
of threonine, followed by rehydration and liberation of ammonia.
- CAPALYTE CATUTYTY: Letreonine - 2.000butanoace + NH(3).
- COPACTOR: Pyridoxal phosphate (By similarity.
- PATHMY: Isolaudine biosyminesis fitter step.
- PATHMY: Isolaudine biosyminesis fitter step.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Schizosaccharomyces pombe (Fission yeast).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     METK_SCHPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Schizosaccharomyces.
                                                                              diphosphate + S-adenosyl-I-methionine.
COPRCTOR: Binds 2 divident ions, such as magnesium c
1 potassium ion per subunit (By similarity).
PATHMAY: Activated methyl cycle.
SIMILARITY: BEDONGS TO THE ADONET SYNTHETASE FAMILY.
                                                                                                                                                                                             FUNCTION: Catalyzes the formation of S-adenosylmethionine from methionine and ATP.
CNTALYTIC ACTIVITY: ATP + L-methionine + H(2)O = phosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    89

- CAPALYTIC ACTIVITY: ATP + L-methionine + H(2)0 = pl diphosphate + 5-adenosyl-L-methionine.

- CoPACTOR: Binds 2 divalent ions, such as magnesium to per subunit (8y similarity).

- pathwar: Activated methyl cycle.

- SUBUNIT: Hectoroferramer.

- SUBUNIT: Hectoroferramer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Garrels J.I., Futcher B., Kobayashi R., Latter G
